TITLE: Photometric determination of microimpurities in rhenium and its preparations

SOURCE: Zhurnal analiticheskoy khimii, v. 19, no. 9, 1964, 1110-1116 27

TOPIC TAGS: spectrophotometry, colorimetric analysis, vanadium, nickel, tin, cobalt, manganese, iron, chromium, zinc, rhenium

ABSTRACT: Since small amounts of impurities affect the properties of rhenium it was necessary to develop a method for the determination of these impurities. The photometric method was used for the determination of vanadium, nickel, tin, cobalt, manganese, iron, chromium and zinc. The optical density of solutions was measured with a SF-5 spectrophotometer and a FEK-M photoelectric colorimeter. The Beer-Lambert law was obeyed for the solutions of all elements except vanadium. The amount of element was determined from the calibration curve or by the method of standard additions. Vanadium was determined from its

Card 1/3

L 16671-65
ACCESSION NR: AP4045848

catalytic effect on the oxidation of aniline with chlorate in a weakly acid medium. At room temperature the rate of reaction is insignificant and the desired sensitivity is obtained by keeping the solution on a steam bath for 10 minutes. Nickel was determined by the extraction-photometric method using α,α' -furyldioxime. Copper interferes with this determination. Tin was determined using 9-phenyl-2,3,7-trihydroxy-6-fluorone as the reagent in the presence of citric acid. The molar extinction coefficient of this complex at 505 m μ is 7.7×10^4 . Manganese was determined as permanganate, produced by oxidation of divalent manganese with potassium periodate. Iron was determined using α,α' -dipyridyl complex with divalent iron. The iron was reduced using hydroxylamine, while thiourea was used for masking copper, silver and mercury. Diphenylcarbazide was used as the reagent for hexavalent chromium. Complexon III was used to increase the stability of ethanolic solutions of diphenylcarbazide. Cobalt was determined using nitro-P salt. Zinc was separated from interfering elements by extraction and determined using methylene blue. Orig. art. has: 1 figure and 8 tables.

TITLE: Determination of rhenium by kinetic method

SOURCE: Zhurnal analiticheskoy khimii, v. 20, no. 9, 1965, 960-965

TOPIC TAGS: rhenium, catalysis, selenium compound, spectrophotometry

ABSTRACT: Small and trace amounts of rhenium were usually determined from their catalytic effect on the reaction between tellurate and bivalent tin in an acid medium. An experiment was made on substituting selenate for tellurate. The reaction $\text{SeO}_4^{2-} + 3\text{Sn}(\text{II}) + 8\text{H}_3\text{O}^+ \rightarrow \text{Se}^{\text{IV}} + 3\text{Sn}(\text{IV}) + 12\text{H}_2\text{O}$ is normally very slow, but it increased noticeably in the presence of rhenium. The rate of catalytic reaction

Card 1/2

UDC: 543.70

L 15999-66

ACC NR: AP5024143

was proportional to the changes with time of the optical density of observation of the reaction for determining the rhenium content. A suspension of elemental Se was obtained in the presence of gum arabic. The optical density of the suspension was measured by the SF-5 spectrophotometer. The transparent selenium hydrosol, in the presence of gum arabic, had a reddish color. The maximal light absorption was found in the ultraviolet part of the spectrum. A study of the catalytic effect of rhenium on the oxidation-reduction reaction between the selenate and bivalent tin, as a function of the type and concentration of acids, selenates, bivalent tin, and foreign admixtures, produced a method for the analysis of phenium-containing substances. For the determination of rhenium in solution, 2 ml of 0.5M potassium selenate solution, 2 ml of 2M tartaric acid solution, 0.2 ml of 2% gum arabic solution, 3 ml of 0.45M of bivalent tin chloride in hydrochloric acid (1:3), and distilled water to the mark. After 30-90 minutes measure the optical density in a cuvette (+ray) with a 10 mm layer at 380-400 m in reference to the water. The duration of the color development depends on the content of rhenium. The reference experiment is necessary. The content of rhenium is determined by the method of additions. Orig. art. has: 14 formulas, 8 figures, and 1 table.

TITLE: Determination of titanium in titanium nitride by photometric titration in a photometric colorimeter

SOURCE: Zavodskaya laboratoriya, v. 32, no. 1, 1966, 24-25

TOPIC TAGS: titanium, titanium compound, photometric analysis, colorimetric analysis, АЛТР/ДЕ

ABSTRACT: Photocolorimetric analysis is carried out in a FEK-type photoelectrocolorimeter by using two methods. The first method requires special devices: a cell-parallelolepipida wooden cell holder, and a mixer. The second method is less convenient but does not require any special arrangement. Titrant is added into a flask containing a titrated solution, the cell is filled with a colored solution, the absorbance is measured with respect to water, the solution is again poured from the cell into the flask, etc. Solutions having an initial absorbance of <1 (better~0.5) should be used with a noticeably high absorption of light and without photocurrent intensification. For making the analysis, an 0.3 g sample of Ti nitride is placed into a 100 ml flask, 20 ml of H_2SO_4 solution (1:1) and 2 g of Na nitrate are added, and the mixture is heated. If

Card 1/2

ACC NR: AP6019018

the sample is not dissolved, then the solution is cooled, 0.5 g of nitrate is added and the mixture is heated up to the beginning of liberation of H_2SO_4 vapors without permitting precipitation. The cooled solution is transferred into a 100 ml measuring flask, 0.5 N H_2SO_4 solution is gradually added, 1 ml of parhydroxyl is poured in, and the content is brought to the mark with the same acid. An aliquot part of the solution is then placed in a titrating glass and neutralized with 10% solution of NaOH until a weak, yellowish-green color appears. Then 7-10 ml of 1 N H_2SO_4 and 25 ml of 0.05 M complexon III are added. After 10 minutes, 3-5 drops of 0.5% xylol orange are added and the excess of complexon is titrated with a 0.05 M solution of Bi nitrate prepared from metallic Bi and 0.5 N HNO_3 . A green filter is used. The equivalent point is found graphically. The Ti content is calculated from the following formula:

$$\%Ti = \frac{(V_1k_1 - V_2k_2)47.9 \cdot 0.05 \cdot 100 \cdot 100}{gV_1 \times 1000} .$$

where V_1 is the volume of the complexon added, V_2 is the amount of Bi nitrate consumed, k_1 and k_2 are correction coefficients, V_1 is the volume of aliquot, and g is the weight of the sample. Orig. art. has: 1 fig. and 1 formula.

abstract 5V318. ("Izv. Leningr. elektrotekhn. in-ta",
1961, no. 45, 311-317)

TEXT: One describes normal algorithms of Markov and the matrice form of the writing down of the algorithms (RZhMat, 1959, 9686). One mentions that the normal algorithms are unhandy for a realisation by machines. Under this aspect the putting down in matrice form is easier. Further on the author constructs a system of s equations by introducing s additional variables, $s = -\lceil \log_2 n \rceil$ and n being the number of operators completely determining the succession of the carrying-out of the operators. The general scheme of a machine which realises the algorithms put down in the manner above mentioned is given.

Nauk S.S.R., Antibiotiki i ikh Primenenie* 22, No. 1, 14-21(1952).—Anatipin (I) (from the liver) and extrazin (II) (from the thyroid) are bactericidal and bacteriostatic against the tubercle bacillus and in large doses, against typhoid, dysentery, diphtheria, proteus, and pyocyanous bacilli. II also stimulates the phagocytic function of the histiocytes. II modifies and vitalizes the course of tuberculosis infection in white mice when given by mouth or subcutaneously. I renders harmless the lethal dose of diphtheria toxin.

TITLE: Stratigraphy of the Tertiary Rocks of the Northeastern
Border of the Donbass (Donets Basin) (K stratigrafii
tretichnykh otlozheniy severovostochnoy okrainy Don-
bassa)

PERIODICAL: Uch. zap. Rostovsk. n/D. universitet, 1956, Vol. 7, Nr 34
pp 59-63

ABSTRACT: The Tertiary beds of the Donbass border (the Morozov-
skiy and Nikolayevskiy rayons) have been divided into
Paleogene and Neogene units on the basis of foraminifer-
al studies. The Kiyevskiy stage has been distinguished
among the Paleogene rocks and has been divided into
lower Kiyevskiy and upper Kiyevskiy layers. The lower
Kievskiy layer is characterized by a group of foramin-
ifers: Listerella subbotinae Nikit., Vaginulinopsis
fragaria Glimb., Gaudryina filliformis Berth., Frondi-

Card 1/2

Stratigraphy of the Tertiary Rocks of the Northeastern Border of the
Donbass (Donets Basin)

Cularia tenuissima Hantken., Saracenaria arcuata (Orb.), and Marginulina subbulata d'Orb. The upper Kiyevskiy layer contains Clavulina szaboi Hantken., Heterostomella gigantica, Vaginulinopsis asperiliformis Nuttall, Bulimina sculptilis Cussh., and Bolivina ex. gr. senariensis Costa. Neogene rocks (Sarmatian stage) have been identified here for the first time; formerly their boundary was placed farther south. In the region of the Latyshev farm (Nikolayevskiy rayon), sandy marls lie on rocks of the Kiyevskiy stage. They contain an assemblage of foraminifers, in which forms characteristic of the Sarmatian stage occur together with typical Kiyevskiy forms. Examples are Elphidium regina (Orb.), E. regina (Orb.) var. caucasica Bogd., E. crispum (Linne), and E. macellum (Fish. and Moll.) Ostracods in the assemblage are Cytheridea latteralis Brady and Candonia albicanis Brady. The Sarmatian rocks are covered by Quaternary non-fossiliferous clays.

TITLE: Methods for measuring the density field of gas flow in a shock tube with the aid
of an interferometer

SOURCE: AN SSSR. Energeticheskiy institut. Fizicheskaya gazodinamika i svoystva
gazov pri vysokikh temperaturakh (Physical gas dynamics and properties of gases at
high temperatures). Moscow, Izd-vo Nauka, 1964, 104-114

TOPIC TAGS: gas dynamics, gas density measurement, shock wave, shock tube, inter-
ferometry, nitrogen shock wave

ABSTRACT: The paper deals with techniques for interferometric studies of shock waves
in a tube. The lengths of the high and low pressure tubes are 0.9 and 3.4 m, respectively,
the internal cross section is 72 x 72 mm, and the side-walls of the end-section are made
of accurately (0.2 band over the entire field) plane-parallel glass. A description of the
electronic details for recording, synchronization, etc. is then given. A Mach-Zehnder
interferometer was used. The 'white' light source provided a light-pulse of 1 μ sec effective
length, by point and line-discharges of a capacitor charge to 10 kV. The scanning
Card 1/2

L 20818-65

ACCESSION NR: AT4048013

method allowed continuous density measurement at a fixed plan with spatial resolution of 1-1.5 mm and time resolution of 2-3 μ sec. The electronic recording system for framing, photography is also described, using an image-converter type PIM-3 made in the laboratory of M. M. Butslov, so that the high-speed processes could be recorded on a fixed film. The shift of bands could be measured on a microscope with an accuracy of less than 0.1 of a band, and the maximum and minimum blackening were measured with an MF-2 microphotometer. The method of calibration is described and the total error in density determination is graphed for incident and reflected shocks as a function of the Mach-number of the incident shock, in nitrogen with an initial pressure of 10 mm Hg and a temperature of 300K. Orig. art. has: 11 figures and 6 equations.

TITLE: Investigation of the interaction of a reflected shock with the boundary layer of flow behind an incident shock wave

SOURCE: AN SSSR. Energeticheskiy institut. Fizicheskaya gazodinamika i svoystva gazov pri vy*okikh temperaturakh (Physical gas dynamics and properties of gases at high temperatures). Moscow, Izd-vo Nauka, 1964, 115-118

TOPIC TAGS: gas dynamics, shock wave, reflected shock wave, boundary layer, interferometry, nitrogen shock wave

ABSTRACT: The paper gives the results of a study of the interaction of the front of a reflected shock wave with the boundary layer of an oppositely directed flow, with the aid of an interferometer and high-speed photography as described elsewhere in this same volume. The experiments were carried out at Mach 3-7 and with initial pressures of 10 and 30 mm Hg in commercial nitrogen (about 0.5% oxygen). The speed was measured by photographing a slitted-off part of the interference pattern on a film moving at 0.117 mm/ μ sec, with an accuracy of 10% for incident and 15% for reflected waves. The density

Card 1/2

L 20820-65

ACCESSION NR: AT4048014

behind the front was also measured and found to be in agreement with calculated values. The interference pattern showed that with Mach numbers up to 6, the perturbation caused by interaction of the reflected shock with the boundary layer of the oppositely directed flow was localized in a certain region adjoining the wall and moving with the reflected shock. After passage of the reflected wave, the gas again became homogeneous. Orig. art. has: 4 figures.

TITLE: Measurement of density behind a reflected shock wave in nitrogen

SOURCE: AN SSSR. Energeticheskiy institut. Fizicheskaya gazodinamika i svoystva
gazov pri vy*okikh temperaturakh (Physical gas dynamics and properties of gases at
high temperatures). Moscow, Izd-vo Nauka, 1964, 119-126

TOPIC TAGS: gas dynamics, shock wave propagation, nitrogen shock wave, reflected
shock wave, gas density oscillatory relaxation

ABSTRACT: The paper is a continuation of previous work by the authors and deals with the
reflection of a shock wave by the solid end of a shock-tube which contains industrial nitrogen
(with about 0.5% oxygen). Using fixed illumination, the change in density with time was
determined by an interference method and recorded on film moving at 0.117 mm/ μ sec, both
for the incident and reflected waves. The shocks propagated at Mach 3 to 6; the initial
pressures were 10 and 3 mm Hg, the maximum temperature in the reflected shock was
4000K and dissociation was 0.2%. The equilibrium and non-equilibrium densities for a
section 52 mm from the end are graphed for Mach 2.9, 3.8 and 5.6. The time to

Card 1/2

L 20819-65

ACCESSION NR: AT4048015

equilibrium density agrees with that of the oscillatory relaxation found by Blackman. The density behind the reflected shock was also obtained by continuous scanning, at 3 mm from the reflecting end of the tube where interaction with the boundary layer can be neglected. At higher Mach numbers density increases with time; thus the density becomes greater than the calculated value and the divergence increases with time. The appendix deals with equilibrium values of thermodynamic parameters behind incident and reflected shocks on the basis of mass, energy and momentum conservation and the equations of state. The results for a shock in nitrogen at 300K and 10 mm Hg are tabulated, and formulas are given for nonequilibrium values of thermodynamic parameters for incident and reflected shock waves. Orig. art. has: 2 tables, 5 figures and 18 equations.

TITLE: Investigation of normal shock wave reflection in a shock tube

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 4, 1964, 143-149

TOPIC TAGS: Mach number, argon, nitrogen, carbon dioxide, shock tube/ Mach Zender interferometer

ABSTRACT: The normal reflection of a shock wave from a solid wall was investigated inside a 72 x 72 mm shock tube with 4.5 mm low-pressure chamber length and 9 mm high-pressure chamber length. Shift in the interference bands ΔS was determined to within 0.1 band on a Mach-Zender interferometer. The absolute errors in density for nitrogen, carbon dioxide, and argon gases were 0.308×10^{-5} , 0.319×10^{-5} , and $0.462 \times 10^{-5} \text{ g/cm}^3$, respectively. First, the state of the gas behind the incident shock wave was studied in N_2 , CO_2 , and argon gas for initial pressures of 10, 30, and 100 mm Hg respectively at $2 \leq M_g \leq 6$. Density measurements were made by means of continuous scanning with a vertical slit. The density field ρ_1/ρ_0 for CO_2 was

Card 1/2

ACCESSION NR: AP4044736

plotted versus M_g for complete thermodynamic equilibrium and thermal equilibrium between translational and 667 cm^{-1} vibrational level, with 1336 and 2350 cm^{-1} frozen. Next, the density field behind the reflected shock wave was measured using both vertical and inclined slits. For $3 < M_g < 4$ and 10 mm Hg pressure the measured density field in CO_2 agreed very well with theoretical calculations. The density field in nitrogen was measured in the range $2 < M_g < 6$. Vibrational relaxation times behind the reflected shock were around $1 \mu\text{sec}$. Argon measurements covered a Mach range $2 < M_g < 5$. It was found that for incident Mach numbers less than six density measurements behind the reflected shock agreed with calculations to within 3%. "The authors are deeply grateful to L. M. Trukhanova for taking part in the experiments and reducing the data." Orig. art. has: 7 figures and 4 formulas.

TITLE: Measurement of the density of carbon dioxide in the stream behind a shock frontSOURCE: AN SSSR. Energeticheskiy institut. Issledovaniya po fizicheskoy gazodinamike (Studies of physical gas dynamics). Moscow, Izd-vo Nauka, 1966, 170-171

TOPIC TAGS: carbon dioxide, shock wave front, thermodynamic equilibrium

ABSTRACT: Studies of carbon dioxide behind a shock front were carried out in the M_s range from 2 to 8. The density in the stream behind the shock front propagating at $M_s < 3$ increases and reaches a value corresponding to a complete thermodynamic equilibrium. This process is caused by a lag of the time of excitation of deformation vibrations ν_1 of the CO_2 molecule. For shock waves with $M_s > 3$, this increase in density was not observed. The densities measured immediately behind the shock front, ρ_1^* , coincide with the average density in the flow, ρ_1 . Comparison of measured and calculated densities leads to the conclusion that the density values immediately behind the shock front coincide within 2-3% with calculated values obtained by assuming a complete thermodynamic equilibrium. Interferograms of the stream show that the density fluctuates about an average value ρ_1 which remains constant within 2-3% over the entire length of the stream, from the shock front to the contact surface. It is concluded

"Anti-Smallpox Vaccination in Children with Allergic Symptoms"
Belgrade, Srpski arhiv za celokupno lekarstvo, Vol 93, No 10,
Oct 1965, pp 943-949

Abstract: In the period 1962-1964, of 3320 children given anti-smallpox vaccinations, every seventh child showed indications of allergy. Children ranging from 23 months to 6 years of age were vaccinated, and a comparison is shown between the group of children with allergic constitutions (108) and the control group. It was concluded that anti-smallpox vaccination can sometimes cause recurrences of allergic diseases which were present prior to vaccination. 8 Yugoslav, 8 Western references. German summary. TITLE: The effect of small aluminum additions on the structure of
uranium-molybdenum alloys

SOURCE: Tehnika, no. 3, 1966, 515-519

TOPIC TAGS: nuclear fuel, fuel element, fuel element material, fuel
element alloy, uranium alloy, molybdenum containing alloy, aluminum
containing alloy

ABSTRACT: A series of uranium-molybdenum alloys containing 0.4—0.6%
molybdenum (a material for fuel elements of gas-cooled reactors) were
studied in order to determine the effect of small additions
(500—1500 ppm) of aluminum on the alloy structure. The experiments
showed that aluminum, which is almost insoluble in uranium, forms nu-
merous nucleation centers, thereby prevents an extensive grain growth,
and reduces the anisotropy, which in alloys with low molybdenum contents
leads to buckling of the fuel elements. An alloy containing 0.6%
